Search Notes

Examiner Garrett:

Please review the attached search results.

I broke the results into three groups.

The first group is claim 47 and claim 21 are together which starts on page 3.

The second group is claim 47 which starts on page 133.

The third group is claim 21 which starts on page 210.

If you have any questions or if you would like to refine the search query, please feel free to contact me at any time.

Thanks you for using EIC 1700 search services!

SEARCH REQUEST FORM

Scientific and Technical Information Center

Pat. & T.M. Office

Requester's Full Name: DAWN GARRETT Examiner #: 76107 Date: 7/28/06
Art Unit: 1774 Phone Number 2-1523 Serial Number: 10/804,788
Mail Box and Bldg/Room Location: Room 10C79 Results Format Preferred (circle): PAPER DISK E-MAIL

If more than one search is submitted, please prioritize searches in order of need.

Please provide a detailed statement of the search topic, and describe as specifically as possible the subject matter to be searched. Include the elected species or structures, keywords, synonyms, acronyms, and registry numbers, and combine with the concept or utility of the invention. Define any terms that may have a special meaning. Give examples or relevant citations, authors, etc, if known. Please attach a copy of the cover sheet, pertinent claims, and abstract.

Title of Invention: ELECTROLUMINESCENT DEVICE

Inventors (please provide full names): (see Bib Sheet)

Earliest Priority Filing Date: 3/19/2004 (Do not limit by date)

For Sequence Searches Only Please include all pertinent information (parent, child, divisional, or issued patent numbers) along with the appropriate serial number.

A Please search
formula (ii) (see cl. 47)

R1001 through R1013 are alkyl groups

B Please search Formulas
4-1 and 4-2 (see cl. 21)

where Ar801 - Ar803 are aryl groups
R801 - R827 are alkyl groups

C Also search answers A + B together

D Combine answers from C with terms (phosphorescent) or

OTHER SOURCE(S): CASREACT 143:267079
AB Heteroleptic cyclometalated Ir(III) complexes featuring
lepidine-based ligands and an acetylacetonate auxiliary ligand were
synthesized. The ligands were prep'd. by the Suzuki coupling
reaction of 2-chlorolepidine with the aryl boronic acids
4-RC₆H₄B(OH)₂ (R = Me₃C, CF₃, Me₂N, Ph₂N), 1-naphthylboronic acid or
9-phenanthreneboronic acid in 64-90% yields. Reaction of these
ligands with IrCl₃ in MeOCH₂CH₂OH-H₂O, followed by treatment with
acetylacetone in presence of Na₂CO₃ in MeOCH₂CH₂OH gave 56-88%
cyclometalated iridium complexes. Multiple lowest energy absorption
bands are obs'd. for these complexes indicating substantial mixing of
the singlet and triplet levels. All the complexes emit orange or
red color in CH₂Cl₂ solns. with lifetimes in the 1.6-3.7 μs
range. The emission in the complexes probably originates from the
3MLCT state. The complexes are applied as emitting guests in LED
devices of the structure ITO/HTL(BPAPF or NPB)/6% Ir in
CBP/BCP/Alq₃/LiF/Al. They exhibit excellent device characteristics
with an orange to red EL profile.

AB The title 1,3-bis(aminophenyl)azulenes were synthesized from
1,3-dihaloazulene in two steps involving the Suzuki cross-coupling
with 4-bromophenylboronic acid and subsequent Pd-catalyzed
amination. Their HOMO energy levels were estd. to be comparable to
that of the widely used hole-injecting (HI) material, copper
phthalocyanine. The application of these diamines to HL materials
in org. electroluminescent (EL) devices was also studied as
non-cyanine and non-polyamine substance.

AB Six novel star-shaped compds. with a triphenylamine core and
carbazole or fluorene sidearms were synthesized by Suzuki
cross-coupling. The star-shaped mols. are able to form mol.
glasses. They were characterized regarding their thermal, optical,
and electrochem. properties. The new compds. were tested as org.
semiconductors in soln. processed org. field-effect transistors
(OFETs). Mobilities of $3 + 10^{-4}$ cm²/(V s), high on/off ratios
of up to 10⁵, and low threshold voltages were obtained. The new
materials show very small hysteresis and an exceptionally high
stability under ambient conditions.

AB The present invention relates to an electrophotog. photoconductor comprising a photoconductive layer, a protective layer, and a conductive support, wherein the protective layer is disposed as the outermost layer of the photoconductive layer, and 20 % by vol. to 60 % by vol. of fine particles of fluorine-contained resin and at least one compd. selected from amine arom. compds. and hydroxy arom. compds. are incorporated into the protective layer. According to the present invention, high durability may be achieved, image degrdn. such as lags may be controlled from the increase of residual potential and decrease of charging, and high quality images may be formed stably even after the prolonged and repeated usage. The present invention also relates to an electrophotog. process, an electrophotog. app. and a process cartridge for the electrophotog. app. which utilize the electrophotog. photoconductor resp.

AB The org. EL element contain org. layers involving at least light-emitting layers, ≥ 1 of which contain compds. having ≥ 1 biaryl moiety structure and dihedral angle θ of the biaryl moiety structure 10-90° in the lowest excited triplet state (T1), calcd. by nonempirical MO method. Preferably, the compds. are represented by the general formulas Z1Ar1Ar2Z2 with $\theta 1$ and Z3Ar3Ar4Ar5Z4 with $\theta 2$ and $\theta 3$ [Ar1-Ar5 = arylene, heteroarylene; Z1-Z4 = diarylamino, arom. heterocyclic group; $\theta 1$ (dihedral angle of Ar1 and Ar2 in T1) = 0-90°; $\theta 2$ (dihedral angles of Ar3 and Ar4 in T1) = 10-90°; $\theta 3$ (dihedral angles of Ar4 and Ar5 in T1) = 10-90°]. Preferably, the light-emitting layer contain phosphorescent compds. selected from Os, Ir, Rh, or Pt complex-based compds. The org. EL device is useful for an illumination of display device which may contain a LCD as an imager.

AB The equipment consists of an org. electroluminescent (EL) device
with max. emission wavelength <500 nm formed on a substrate, which
contains dispersed phosphors absorbing emission light from the org.
EL device as an excitation light and emit light at wavelength longer
than that of the excitation light, and preferably shows haze
≥15% and <90% and total light transmittance ≥50% and
<95%. The equipment emits white light with high luminescence
efficiency.

AB The devices have, in their constituent layers (e.g., emitting layers, hole- or electron-transporting layers), (i) compds. represented by $X1R1C:CR2X2$ [$X1, X2$ = aryl, heterocycle; $R1, R2$ = aryl, heterocyclic hydrocarbyl, cycloalkoxy ($R1 = R2$ = aryl)], $R1R12R13R14R15P$ ($R11-R15$ = monovalent substituent), $Ar2Ar1C6H4(m-Ar1Ar2)$ [$Ar1$ = bivalent arom. hydrocarbylene; $Ar2$ = (substituted) Ph; H atom on the benzene ring may be substituted with (cyclo)alkyl, alkoxy, or halo], $Z(ArQ)n$ [Q = (substituted) o-(2-pyridyl)phenyl; Z = n-valent bridging group, single bond; Ar = bivalent arylene; $n = 2-8$], etc., (ii) fluorescent compds. with mol. wt. 500-2000 and at. ratio $F/(F + H)$ 0-0.9 and having fluorescent peak at ≤ 415 nm, (iii) polysilanes $(R21R22Si)n$ [$R21, R22$ = alkyl(oxy), arom. group, aryloxy; $n1 \geq 3$] or $[R31(Ar31NR32R33)Si]n$ [$R31$ = alkyl(oxy), arom. group, aryloxy; $R32, R33$ = alkyl, arom. group; $Ar31$ = arylene; $n2 \geq 3$], and/or (iv) fluorescent compds. satisfying at. ratio N/C 0-0.05. The devices, having phosphorescent dopants I ($Z11$ = arom. azacycle; $Z12$ = nonarom. ring, 5-membered arom. ring, azulene; M = metal), II ($Z21, Z22$ = arom. azacycle; M = metal), or III ($Z41$ = azacycle; $Z42$ = ring; M = metal) in emitting layers, are also claimed. The devices exhibit high luminescent efficiency and substantially white emission, and are suited for light source uses, esp. of LCD.

AB Org. electroluminescent comps. are described which comprise a charge transport matrix comprising ≥ 1 electron transport material; ≥ 1 non-polymeric emissive dopant; and ≥ 1 tertiary arom. amine. Preferably, the tertiary amine has a hole mobility greater than about .gtorsim.10-5 cm/s and an ionization potential of 4.8-5.4 eV. Org. electroluminescent devices, including displays, employing the materials are also described. Methods of making org. electroluminescent devices are described which entail selectively transferring the comps. of from a donor sheet to a receptor substrate; donor sheets suitable for the process are also described.

AB Provided are novel spirobifluorenes (I; A1, A2 = optionally substituted polycyclic arom. of heterocyclic group; R1-R4 = H, org. group, substituted amino, CN, halogen). Org. electroluminescence devices using the spiro compd. have an optical output with an extremely high efficiency and a high luminance, and an extremely high durability. In an example, 2,2',7,7'-tetrabromo-9,9'-spirobifluorene was treated with 9,9-dimethylfluorene-2-boronic acid in the presence of Pd(PPh3)4 to give a spirobifluorene compd. contg. 4 dimethylfluorene groups.

AB The invention relates to an org. electroluminescent device comprising org. layers sandwiched between an anode and a cathode, wherein, at least, one of the org. layers is formed by a wet process, such as ink-jet printing, spin coating, etc., using the soln. contg. the org. compd. having the glass transition temp. in 80-250 °C and purified by a sublimation method. One of the org. layers prepd. by the wet process may be an electroluminescent layer that comprises a host material and a **phosphorescent** guest material.

AB The present invention relates to an electrophotog. photoreceptor including at least an electroconductive substrate; and a photosensitive layer located overlying the electroconductive substrate, wherein the photosensitive layer comprises an amino compd. The present invention provides an electrophotog. photoreceptor having high durability against a repeated use for a long time, preventing deterioration of image d. and blurred images and stably producing high quality images.

AB Multicolored light-emitting app. comprising a first org. electroluminescent element having a first max. emission wavelength in a blue light wavelength region; and a second org. electroluminescent element having a second max. emission wavelength longer than the first max. emission wavelength are described in which the first org. electroluminescent element comprises a first light emission layer contg. a first host and a first dopant, and the second org. electroluminescent element comprises a second light emission layer contg. a second host and a second dopant, and each of the first and second hosts has an emission wavelength region which is shorter than the blue light wavelength region. Preferably, the first org. electroluminescent element comprises a first light emission layer contg. a first host and a first dopant, a first hole transporting layer contg. a first compd., which is provided adjacent to one side of the first light emission layer, and a first electron transporting layer contg. a second compd., which is provided adjacent to another side of the first light emission layer, and the second org. electroluminescent element comprises a second light emission layer contg. a second host and a second dopant, a second hole transporting layer contg. a third compd., which is provided adjacent to one side of the second light emission layer, and a second electron transporting layer contg. a fourth compd., which is provided adjacent to another side of the second light emission layer, and the max. emission wavelength of the first and second hosts is ≤ 415 nm, the max. emission wavelength of the first compd. and the max. emission wavelength of the third compd. are ≤ 415 nm and are the same, and the max. emission wavelength of the second compd. and the max. emission wavelength of the fourth compd. are ≤ 415 nm and are the same. Methods for fabricating the elements are described which entail simultaneously forming the hole transporting layer of each of the org. electroluminescent elements, sep. forming the light emission layer of each of the org. electroluminescent elements, and simultaneously forming the electron transporting layer or the hole blocking layer of each of the org. electroluminescent elements. Use of the elements in displays and as light sources for copiers and printers is indicated.

AB Multilayered org. light-emitting devices are described which are provided with hole-injection and/or hole-transport layers comprising aryl amine compds. (e.g., thermostable aryl amine compds.). The devices allow for a staircase change in the energy difference of holes and electrons as they migrate from the electrodes toward the emitter layer, resulting in a lower operating voltage and a high quantum yield of luminescence for a given c.d. Microdisplay devices employing the multilayered org. light emitting diode devices are also described.

AB Hole-injection or hole-transport compds. are described by the general formula I (R1 = independently selected hydrogen, C1-6 (un)branched alkyl, alkoxy, -CN, -Cl, -Br, -CF3, thio, silyl, (un)substituted vinyl, and (un)substituted aryl groups). The structures of various substituents attached to the nitrogen group allow the adjustment of the glass transition temps. and ionization potentials of the compds. Org. light-emitting devices and microdisplay devices comprising the compds. in the hole-injection/hole-transport layers are also described.

AB Electroluminescent (EL) devices are described which contain star-burst amines N(A1Ra)(A2Rb)A3Rc (A1-A3 = biaryl; Ra-Rc = NAr1Ar2, arom. condensed group I, II; Ar1, Ar2 = aryl, R1-R8 = H, halogen, hydrocarbon group, alkoxy; X = O, S, alkylene). Electrophotog. display parts using the amines are also claimed. The amines are manufd. by a process including reaction of RaA1NH2, RbA2I, and RbA3I in the presence of Cu complex catalysts. The EL device shows enhanced heat stability, driving stability, and durability.

AB The electrophotog. photoreceptor comprises a photosensitive layer on an elec. conductive support, wherein the photosensitive layer contains I and II (R1,3,4 = H, amino, etc.; R2 = H, alkoxy, etc.; m,n,p,q = 1-4; Ar = III, IV; R5,6 = substituent). The electrophotog. photoreceptor provided high sensitivity by combining 2 types of sp. charge-transporting compds.

AB Disclosed is an org. electroluminescent device comprising at least an anode, a cathode and an org. light-emitting layer interposed between the electrodes, wherein the org. light-emitting layer contains one or more host materials, a hole-trapping dopant and an electron-trapping dopant. By having the hole-trapping dopant and the electron-trapping dopant coexist in the org. light-emitting layer, the org. electroluminescent device can have a longer life.

AB The invention relates to an org. electroluminescent device comprising a transparent electrode made of a conductive metal oxide, a buffer layer for facilitating the current injection, an org. electroluminescent layer including the active layer, and a reflective electrode, stacked in that order on a substrate, wherein the metal constituting the transparent electrode, its fluoride, Al and AlF₃ are contained in the buffer layer for enhancing the current injection efficiency as well as maintaining the sufficient transparency.

AB Disclosed is a novel arom. amine deriv. having an asym. structure. Also disclosed is an org. electroluminescent device wherein an org. thin film layer composed of one or more layers including at least a light-emitting layer is interposed between a cathode and an anode and at least one layer of the org. thin film layer contains the arom. amine deriv. by itself or as a component of a mixt. This org. electroluminescent device hardly suffers from crystn. of mols., and has improved prodn. yield and long life. The arom. amine deriv. enables to realize such an org. electroluminescent device.

AB The device comprises a substrate, a reflection electrode, an org.
electroluminescent layer, a transparent electrode, and a trapping
agent layer, with the trapping layer contg. ≥ 1 compd(s).
contained in the layers forming the device. The trapping layer may
be formed by vapor deposition. Also claimed are the said devices
including ≥ 1 trapping agents selected from anthracene,
coronene, perylene, rubrene, C₆H₅XZ (X = C₆H₄, etc.; Z = Ph,
naphthyl, etc), certain complexes of Al, Be, Zn, Mg, Ga, etc.,
oxadiazoles, triazoles, thiophenes, etc. The org.

electroluminescent layers can be protected from water and O.

AB The invention relates to an org. electroluminescent (EL) device comprising at least a neg. electrode, a light-emitting layer, a hole injection layer and a pos. electrode sequentially formed on a substrate in this order, where the hole injection layer contains a metal oxide. Examples of such a metal oxide include oxides of group III-XIII metals in the long form periodic table.

AB An org. electroluminescent device is disclosed which comprises at least two or more light-emitting layers arranged between an anode and a cathode, and an intermediate electrode layer interposed between the light-emitting layers. The intermediate electrode layer is a single layer or a multilayer body composed of multiple layers, and at least one layer of the intermediate electrode layer is made of a semiconductor material having a resistivity of 0.001-10,000 $\Omega \cdot \text{cm}$. This org. electroluminescent device and a display using such an org. electroluminescent device are highly efficient and have long life.

AB A white org. electroluminescence device comprising, between a pair of electrodes, ≥ 2 light-emitting layer and an electron transport layer made of a N-contg. heterocyclic deriv. or a Si-contg. heterocyclic deriv. The energy gap of the host material contained in the light-emitting layers is limited in a specific range, and the energy gap of the N-contg. heterocyclic deriv. or a Si-contg. heterocyclic deriv. contained in the electron transport layer is limited in a specific range. The ionization potential of the N-contg. heterocyclic deriv. or Si-contg. heterocyclic deriv. of the electron transport layer and that of the host material of the light-emitting layer in contact with the electron transport layer satisfy a specific relation. The white org. electroluminescence operates on low voltage at high luminous efficiency, have a long life, and does not change in chromaticity.

AB The org. EL device has an org. electroluminescent part having an optical micro-resonator (microcavity) structure and emits light in violet (purplish blue or bluish purple) region and a color converter which comprises inorg. phosphors with grain size 0.05-1.0 μm emits visible fluorescent light by absorbing the light from the org. EL part. The inorg. phosphor may contain Ba and Si, Ba and Mg, or K and W, preferably, $\text{Ba}_2\text{-aEuSiO}_4$, $\text{Ba}_1\text{-aEuMgAl}_{10}\text{O}_{17}$, or $\text{K}_5\text{Eu}_2.5(\text{WO}_4)_6.25$. The org. EL part may be comprise a transparent substrate/half mirror/luminescent layer-contg. org. compd. thin-film/light reflector laminate. The half mirror part may comprise a dielec. mirror/transparent electrode laminate, the dielec. mirror being on the substrate side. The light reflector may comprise a metal electrode. The color converter may be provided under the dielec. mirror. The dielec. mirror may comprise a laminate of SiO_2 -based layers and TiO_2 -based layers, and preferably, ≥ 1 layer contain Si oxynitride or Ti oxynitride. The substrate may comprise a transparent resin film. The org. EL display has low water vapor permeability and is suitable for a portable appliance.

 AB A novel family of amorphous mol. materials that function as hole
 blockers in org. electroluminescent (EL) devices,
 tris(2,3,5,6-tetramethylphenyl)borane (TPhB), tris(2,3,5,6-
 tetramethylbiphenyl-4-yl)borane (TBPhB), tris(2,3,5,6-tetramethyl-
 1,1';4',1''-terphenyl-4-yl)borane (TTPhB), and tris[4-(1,1';3',1''-
 terphenyl-5'-yl)-2,3,5,6-tetramethylphenyl]borane (TTPhPhB), have
 been designed and synthesized. They readily form stable amorphous
 glasses with high glass-transition temps., and are characterized by
 reversible cathodic redn. and relatively large HOMO-LUMO energy
 gaps. High-performance blue- and blue-violet-emitting org. EL
 devices have been developed using TBPhB, TTPhB, and TTPhPhB as hole
 blockers and N,N'-di(1-naphthyl)-N,N'-diphenyl[1,1'-biphenyl]-4,4'-
 diamine, tri(p-terphenyl-4-yl)amine, and N,N'-bis(3-methylphenyl)-
 N,N'-diphenyl-[1,1'-biphenyl]-4,4'-diamine as emitters.

AB Org. electroluminescent elements are described which comprise a
light-emitting layer contg. a fluorescent compd. and a
phosphorescent compd., the fluorescent compd. having a nitrogen atom
no. to carbon atom no. ratio in the mol. (N/C) of 0-0.05 and for
which the max. emission wavelength of light emitted according to
electroluminescence of the element is longer than the max.
fluorescence wavelength of the fluorescent compd. Displays
employing the elements are also described.IT 405171-49-5 405172-39-6 405173-85-5

 AB The electroluminescent (EL) device has a light-emitting layer contg. an org. compd. with band gap 2.96-3.80 eV and mol. wt. 600-2000 and a phosphor. The display has (A) the above EL device or (B) a conversion layer for absorption of the emission of the above EL device and emission with different max. wavelength. The use of ≥ 2 EL devices or conversion layers with different max. emission wavelength enables full-color display devices. The display device shows low elec. power consumption because of high emission efficiency to improve service life.

AB Claimed is a method for producing an arom. amino compd. represented by the general formula Ar1-N(Ar2)-H (wherein Ar1 and Ar2 are each a substituted or non-substituted hydrocarbon group having 2 to 50 carbon atoms or a heterocyclic group), which comprises reacting an amino compd. represented by the general formula H2N-R1 (wherein R1 is a substituent having 2 to 50 carbon atoms) with an aryl halide mixt. represented by the general formula Ar1-X and Ar2-X (wherein Ar1 and Ar2 are as defined above and X is a halogen) in the presence of a noble metal catalyst, to synthesize an arom. amino compd. intermediate represented by the general formula Ar1-N(Ar1)-R1, and removing the substituent R1 of this compd. The method can be employed for producing an arom. amino compd. in high yield with good efficiency, without the use of a highly toxic raw material such as β -naphthylamine, 4-aminodiphenyl, or benzidine which is designated as a special chem. and whose prodn. is banned in Japan. Arom. amino compds. are useful as elec. charge transporting materials for electrophotog. photoreceptors and org. electroluminescence devices. Thus, 60 mL dry toluene, 2.04 mmol benzylamine, and a toluene soln. of tris(tert-butyl)phosphine (2.22 M, 169 μ L, 0.374 mmol) were added to 10.0 g 4-bromobiphenyl, 4.32 g potassium tert-butoxide, and 42.0 mg Pd(OAc)₂ under Ar and stirred at room temp. for 15 min and 120° for 7.5 h to give 87% N,N-di(4-biphenyl)benzylamine which (1.35 g) was hydrogenolyzed over 135 mg 10% Pd-C in a mixt. of 100 mL CHCl₃ and 20 mL ethanol under vigorous stirring at room temp. for 30 h to give 94% di(4-biphenyl)amine (I). Dry toluene (10 mL) and a toluene soln. of tris(tert-butyl)phosphine (2.22 M, 13.4 μ L, 0.0296 mmol) were added to 500 mg I, 231 mg 4,4'-dibromobiphenyl, 157 mg potassium tert-butoxide, and 3.4 mg Pd(OAc)₂ under Ar and gradually heated to 115° with stirring and stirred at 115° for 6 h to give 77% N,N,N',N'-tetra(4-biphenyl)benzidine (II).

AB A novel family of electron-transporting hole blockers,
 1,3-bis[5-(dimesitylboryl)thiophen-2-yl]benzene and
 1,3,5-tris[5-(dimesitylboryl)thiophen-2-yl]benzene (TMB-TB), were
 designed and synthesized. They exhibit multiple redox behavior in
 electrochem. redn. and to readily form stable amorphous glasses with
 high glass-transition temps. >100°. TMB-TB was proven to
 function well as a hole blocker in blue-emitting org.
 electroluminescent devices.

AB The hole-transporting agent is a triarylamine deriv.
 N(Ar1NR1R2)(Ar2NR3R4)(Ar3NR5R6) [I; R1-6 = (substituted) aryl; Ar1-3 = (substituted) arylene]. The electroluminescent device has a I-contg. layer, preferably a hole-injection layer or a light-emitting layer. The electrophotog. photoreceptor contains I and a charge-generating agent. I gives electroluminescent devices with high emission, efficiency, and long service life and electrophotog. photoreceptors with high sensitivity and durability in repeated use.

AB Novel amine compds. useful as electron-transporting materials to be incorporated in org. electro-luminescence (EL) devices are described, e.g., having the formula I [R1, R2 = H, alkyl, alkoxy, Ph, alkylphenyl, alkoxyphenyl, with the proviso that ≥ 1 of R1 and R2 is n-Bu, i-Bu, sec-Bu, tert-Bu, Ph, alkoxyphenyl, alkylphenyl; R3 = H, alkyl, alkoxy, Cl]. Five more Markush structures are given. The org. EL device can find wide application in various display units, requires a low applied voltage and exhibits a high luminance and an excellent stability.

AB A phosphorescent organometallic complex is described for use as a light-emitting element having good chromaticity for light-emitting devices. Thus, the organometallic complex includes a structure I (R1 = C1-4 alkyl; R2-R5 = H, halogen, acyl, alkyl, alkoxyl, aryl, CN, heterocycle; Ar = aryl, heterocycle, preferably, an aryl group has an electron withdrawing group or a heterocyclic group has an electron withdrawing group; M = Group 9- or Group 10 element).

AB An org. electroluminescent display (OLED) device and a method of fabricating the same are disclosed. The OLED device includes a substrate, a first electrode, an org. layer contg. at least one light emitting layer, and a second electrode. The light emitting layer comprises at least one phosphorescent dopant and at least two host materials. Thus, e.g., the following device fabricated by a laser-induced thermal imaging process: NPD (50 nm, hole-injecting and hole-transporting layer) is deposited on ITO; bis(2-phenylquinoline)iridium acetylacetonate - a phosphorescent dopant - is doped at 5% wt./wt. to a host material of CBP (25%) and Balq (75%) to form a light-emitting layer (30 nm) in the donor substrate; the NPD layer is arranged to face the transfer layer of the donor substrate, laminated, and then laser irradiation of the donor substrate transfers the light-emitting layer; thereafter Balq (5 nm, hole-blocking layer) and Alq3 (20 nm, electron-transporting layer) are deposited, then LiF (1 nm) and Al (300 nm) exhibited an efficiency of 9 cd/A, life span @ 1000 cd/m² of 5000 h, and no crystallization vs. 2 cd/A, 50 h, and crystallization when only a single host material was used.

AB The invention relates to a phosphorescence emitting solid comprising an organometallic complex which has a tridentate ligand coordinating to a central metal through two nitrogen atoms and one carbon atom positioning between the two nitrogen atoms and binding with the two

nitrogen atoms via bonds and has a halogen atom as a ligand; a luminescent element using the solid; and an org. EL device using the element. The phosphorescence emitting solid can emit a phosphorescence having very high intensity in a solid state, and thus, the use of the solid in an org. EL element allows the significant improvement of the luminous efficiency, which results in the redn. of elec. power consumption in an org. EL device.

AB A full color org. electroluminescent device is described comprising a substrate; a first electrode formed on the substrate; an org. emitting layer formed on the first electrode, and having a red-emitting layer, a green-emitting layer and a blue-emitting layer, resp. patterned in a red pixel region, a green pixel region and a blue pixel region, wherein each of the red and green-emitting layers comprises a phosphorescent material and the blue-emitting layer comprises a fluorescent material; a hole blocking layer formed on the org. emitting layer as a common layer; and a second electrode formed on the hole blocking layer. The full color org. electroluminescent device may have enhanced lifetime and luminous efficiency characteristics.

AB The devices have, between anode layers and cathode layers, emitting
layers wherein av. content of emitting materials are smaller in the
30-vol% regions in either the cathode or the anode side than that in
the remaining regions. The emitting materials may be hole- or
electron-transporting (phosphorescent) dopants. The devices
suppress generation of triplet-triplet extinction that leads to
biased recombination in the emitting layers.

EL device contains carbazol derivs. represented by the general formula I (R1 = H, substituent, F-contg. alkyl; when R1 = H or substituent, ≥1 of R2-R9 = F or F-contg. alkyl and other R2-R9 = H or substituent; when R1 = F-contg. alkyl, R2-R9 = H or substituent). The org. EL device will contain I and phosphorescent dopants in the light-emitting layer.

AB A material for an org. electroluminescence (EL) element comprising a compd. having a specific N-contg. condensed ring structure; and an org. EL element which comprises a cathode, an anode and, sandwiched between them, ≥ 1 of org. thin film layers, wherein at least 1 org. thin layer is an org. EL layer contg. the above material for an org. EL element. The material for an org. EL element can provide an org. EL element being capable of achieving high luminous efficiency with a low elec. voltage.

AB An org. electroluminescent device having, between a cathode and an anode, a light-emitting layer which is made of at least a phosphorescent material and a host material, has an electron injection layer arranged between the light-emitting layer and the cathode and having a junction with the light-emitting layer. The light-emitting layer has electron transport properties and the ionization potential of the host material is 5.9 eV or less. The energy gap of an electron transport material in the electron injection layer is smaller than that of the host material in the light-emitting layer, or the triplet energy of the electron transport material in the electron injection layer is smaller than that of the host material in the light-emitting layer. The org. electroluminescent device uses light emission of phosphorescence and has high luminous efficiency.

AB An org. electroluminescent device comprises a light-emitting layer contg. a host compd. and a phosphorescent compd., wherein a carbazole I [R1-13 = H, monovalent substituent; at least one of R1-8 is Q; Z1-2 = at. group forming arom. ring; R21-24 = H, monovalent substituent; n = 0, 1; at least one of R23-24 is monovalent substituent when n = 0; at least one of R21-24 is monovalent substituent when n = 1]. The phosphorescent compd. may be an iridium compd., osmium compd., and/or a platinum compd. The device achieves high emission efficiency, high luminance, and durability.

AB Two neutral pyrazolato diimine Re(I) carbonyl complexes [Re(CO)₃(N-N)(btpz)] where N-N = 2,2'-bipyridine (1) and 1,10-phenanthroline (2), and btpz = 3,5-bis(trifluoromethyl)pyrazolate, were synthesized and characterized by elemental anal., routine spectroscopic methods, and single-crystal x-ray diffraction study. Ground and excited state properties of these complexes were studied by steady-state and time-resolved spectroscopies. Complexes 1 and 2 show photoluminescent emission in both soln. and solid-state at room temp., arising from metal-to-ligand charge-transfer (MLCT) transition with strong overlapping of intraligand $\pi \rightarrow \pi^*$ transitions. The long-lived excited state lifetimes of complexes 1 and 2, which are on the order of microseconds, indicate phosphorescent emission. As these complexes hold the potential to serve as phosphors for org. light-emitting diodes (OLEDs), their electroluminescent performances were evaluated by employing them as dopants of various electron transport layer (ETL) or hole transport layer (HTL) hosts. For complex 1, a green electrophosphorescence emission centered at $\lambda_{\text{max}} = 530$ nm was obsd. at low turn-on voltage (.apprx.6 V) with luminous power efficiency of 0.72 lm/W, external quantum efficiency of 0.82%, and luminance of 2300 cd/m² at a c.d. of 100 mA/cm².

AB Emissive layers of org. light-emitting devices are described which comprise a phosphorescent organometallic compd. for enhancing the quantum efficiency of the org. light-emitting device. Preferably the emissive mol. is selected from the group of phosphorescent organometallic complexes, including cyclometallated platinum, iridium, and osmium complexes. The org. light-emitting devices optionally contain an exciton blocking layer. In particular, org. light-emitting devices with an emitter layer comprising organometallic complexes of transition metals of formula L2MX, wherein L and X are distinct bidentate ligands and M is a metal which forms octahedral complexes, are described. A method of making a compn. of the formula L2MX is described which entails combining a bridged dimer of formula L2M(μ -Cl)2ML2 with a Bronsted acid XH to make the desired organometallic complex. Display devices incorporating the light-emitting devices are also described.

OTHER SOURCE(S): MARPAT 135:53380

AB Org. light-emitting devices are described in which an emitter layer
 comprises compds. (e.g., as dopants within a host) which are
 described by the general formula L₂MX (L and X are inequivalent
 bidentate ligands; and M is a metal which forms octahedral
 complexes). Devices with emitter layers comprising phosphorescent
 compds. described by the general formula LL'L"M (L, L', and L" =
 inequivalent bidentate ligands) and comprising L'''₂M (L''' = a
 monoanionic bidentate ligand coordinated to M through an sp² carbon
 and a heteroatom; and wherein the heteroatoms of the two L ligands
 are in a trans configuration) are also described. The prepn. of
 L₂MX by combining a bridged dimer described by the general formula
 L₂M(μ-Cl)₂ML₂ with a Bronsted acid XH to make an organometallic
 complex of formula LMX is also described. Synthetic options allow
 insertion of fluorescent mols. into a phosphorescent complex,
 ligands to fine tune the color of emission, and ligands to trap
 carriers. 3-Methoxy-2-phenylpyridine.
